Project Overview

This repository contains a comprehensive analysis of U.S. Senate election polls conducted every August from 1990 to 2016.

The goal: Compare Democratic and Republican polling performance across:

- **49 U.S. states** (identifying regional voting blocs)
- **3 Senate classes** (understanding election cycle dynamics)
- **26 years of data** (tracking partisan shifts over time)

Problem Statement

What are we looking for;

What is the count of Democratic and Republican Poll across the 26 years of data?

What is the comparison of Democratic and Republic Election Results across the years?

Which state votes most between the Democratic and Republican Poll?

Who win between Democratic and Republican Poll in the senate class?

Data Source

The primary data source for this analysis is an Excel file, containing 595 records across 11 columns. I got the data from GitHub offering a realworld dataset for case study analysis.

Tool:

Excel

Pivot Table

Pivot Chart

Methodology

The data was cleaned using Excel. Using Excel Pivot Table and Pivot Charts. I performed the following cleaning procedures:

The data were checked and were made whole numbers instead of decimals for uniformity. Then, the data were loaded into pivot table and then pivot charts was done.

Key Insights

Looking through the trends, both the democratic and republican has the same number of polls.

This result shows the democratic election results, the year 2006 has the highest, followed by the year 2010.

For republican, year 2010 has the highest number of votes followed by the year 2016 which is 10 years later.

In this chart, the democratic maintain steady increase across the first two years, then, the republican has more results than democratic and the democratic continues till 2006 where there is high increase. In the year 2010 and 2016, there is distinct difference between the two as the republican increase with higher numbers.

In this chart across these states, AKstate republican has higher election results AK

In each senate class, class 3 has the highest number of both republican and democratic election results followed by senate

U.S. Senate Election Poll Analysis (1990–2016)

Project Overview

This repository presents a data driven analysis of U.S. Senate election polling data, collected every August from 1990 to 2016. The project focuses on evaluating and comparing the polling performance of Democratic and Republican parties across multiple dimensions. Specifically, the analysis explores:

Geographic voting patterns across 49 U.S. states to identify regional political blocs.

Electoral cycle dynamics by examining polling results across the three Senate classes.

Longterm partisan trends over a 26year period to track shifts in voter sentiment.

Problem Statement

This analysis seeks to answer four key questions:

1. Polling Volume: How many Democratic and Republican polls were recorded across the 26year span?
2. Electoral Performance Trends: How do Democratic and Republican election results compare year over year?
3. State Level Preferences: Which states show the strongest polling support for Democrats and Republicans?
4. Class Level Outcomes: Which party performs better in each of the three Senate classes

Data Source

The dataset used in this project is a publicly available Excel file containing 595 records across 11 columns. It was sourced from GitHub and serves as a real world case study for exploratory data analysis and visualization.

Tool Stack:

Microsoft Excel

Excel Pivot Tables

Excel Pivot Charts

Methodology

The analysis was conducted entirely in Excel, following a structured workflow:

Data Cleaning:

All numerical fields were standardized to whole numbers to ensure consistency and accuracy during aggregation and comparison.

Exploratory Analysis:

Data was summarized and transformed using Excel Pivot Tables to generate cross tabulations and summary statistics by state, year, and Senate class.

Visualization:

Pivot Charts were created to visually represent trends, comparisons, and distributions, making the insights more accessible and interpretable.
